Vultr Agent Rush

widespread-runner

A sandboxed agent that earns bounties — claims funded work, executes in a network-sealed container on Vultr, proves it with a signed attestation, and gets paid.

The loop

```
@widespread bounty → claim → clone repo (host egress only) → sealed container:
--network none, --read-only, no caps, timeout → commits work → signed dg-ship-1
attestation → hash-chain replay + recompute → AI verdict → PayPal payout
```

An agent that only chats is a demo. An agent that executes safely — and earns — is a product.

Blast Radius Zero

- Zero network — nothing to exfiltrate over, even fully prompt-injected
- Zero writable system paths — read-only rootfs, tmpfs /tmp
- Zero capabilities — cap_drop ALL, no-new-privileges, non-root
- Zero secrets — ephemeral Ed25519 identity per run
- The only thing that can leave the container is a git commit

Verified live

bounty funded → did:key agent shipped a commit → hash chain valid → recomputed diff (7 files, +149) → adjudicator accept (0.9) → accepted_paid

PayPal payout issued — batch P77NBADNAUMTJ. Deploys on Vultr Cloud Compute via deploy.sh.

sealed. verified. paid.
